

## **A new level of mixing perfection from Xylio**

6<sup>th</sup> December 2011, Bucharest, Romania

Xylio ([www.xylio.com](http://www.xylio.com)) is pleased to announce the 3<sup>rd</sup> major release of FutureDecks DJ pro with significant enhancements to its already feature-rich audio-video DJ mixing application. DJ software has been Xylio's main focus since 2003, FutureDecks DJ pro being the result of the company's experience and dedication. This new release comes with over 50 new features that are bound to suit the needs of any aspiring and professional DJ or VJ.

An extended history in the development of DJ software led to the creation of a software that significantly improves the experience of mixing music and videos through professional features and a stylish user-friendly interface that keeps pros and beginners alike focused on their creative flow. This is achieved through new features such as being able to connect up to 8 hardware MIDI/HID controllers at the same time that gives complete control over mixes without even touching your computer. The 4 decks can be completely synchronized with one another, allowing for complex mash-ups and mixing sessions.

The software comes with a very powerful and flexible sampler where beats and jingles can be loaded. Loops made in any of the 4 decks can also be sent to any of the 8 sampler's banks. The loops will also be in-sync with the other decks allowing for a seamless experience. Loops can also be saved and recalled later on.

For musically perfect mixes the key can be changed or locked (master tempo) to achieve not only beat-matched but also key-matched mixes. FutureDecks DJ pro even detects the key of a song/video to considerably simplify harmonic mixing.

Many practical features have also been added. Color markers enable the user to assign colors to particular tracks so that they stand out and are easier to find. The Audio, Video and Karaoke buttons help filter the playlist by each format. The user can also choose between the Audio and Video Mode. The Audio mode displays 4 vertical waveforms that make it easy to visually align the beats of all 4 decks. The Video mode makes room for the video screen, as well as two smaller video previewing screens, thus providing a complete VJ-ing experience.

There are over 25 zero-configure controllers supported from Akai, American Audio, Beamz, Behringer, Denon, Hercules, M-Audio, Numark, PCDJ, Reloop, Vestax. Any other MIDI controller can be used and visually mapped by using the intuitive LEARN feature. For more advanced users controllers can be programmed through JavaScript to fulfill any DJ-ing commands, ensuring limitless functionality and control.

Even though the FutureDecks DJ Pro was made to be used in live conditions, almost all of its functions can be automated in such a way that the software ends up doing all the hard work. A good example is the AutoMix mode that enables the software to work on its own, mixing songs without any human intervention whatsoever. Both songs rhythm and volume are automatically synchronized and the beats are perfectly overlapped to create quality beat-matched mixes.

### **Supported Languages**

US English

## **System Requirements**

- Mac running Lion (10.7.x) or Snow Leopard (10.6.7 or later)
- PC running Windows 7 / Vista / XP SP2 or later
